

Day 6 report

There was the first day I meet the mentors Sharon. He explained about company and she explained role and she tell basics of datascience and she ask me what you want to learn

I told to learn about html,css,java script. She teach about basic things in html to create a web page in small content and tell to do and I do the webpage heading1 and heading 2 and she give the task of html create small webpage in basic method and afternoon itself Richy Bro teach about the data science and he give the task to fill the value of Data science teaching often begins with foundational programming in Python or R, emphasizing data manipulation and visualization using libraries like Pandas and Matplotlib. Statistical concepts, including probability and hypothesis testing, are introduced early, followed by machine learning algorithms. Practical application is key, with students working on real-world datasets, fostering problem-solving and critical thinking. Project-based learning encourages independent exploration and reinforces theoretical knowledge. Effective teaching also involves clear communication of complex concepts and continuous feedback, ensuring students grasp the iterative nature of data science.
